

Doom PWAD QA Report

Purpose

This report details the Quality Assurance (QA) evaluation of a Doom PWAD, specifically focusing on the E1M1 map's gameplay and technical performance using the supplied test environment and agentic AI. The primary goal is to assess map navigation, combat engagement, resource management, and secret discovery within the given test parameters.

Summary

The test run evaluated the 'E1M1' map, using difficulty level '3', with a total duration of 5 seconds. The test concluded with an outcome of 'map_completed', indicating the agent successfully reached the map's exit condition. During the run, 0 kills were registered, 0 items were collected, and 0 secrets were found. The agent finished with 100 HP and 0 armor, having taken 1 action in total. The test involved 1 LLM call.

Environment

The test was executed using the 'gemini-2.5-flash' LLM model and the 'freedom1' IWAD. The maximum tick limit for the run was set to 5. The full recording of the session is available at </media/steven/MaD/matznysh-hna/Agentic-PWAD-QA-Doom/Backend/storage/recordings/a136f95c-c7d2-4f89-aaf8-68e879a31a5d.mp4>.

Defects

No specific defects were identified or reported during this test run. There was 1 notable event recorded, but without further detail, its nature cannot be described. The extremely short duration (5 seconds) and minimal actions (1) suggest that the test either concluded prematurely due to reaching max ticks, or the map itself is exceptionally brief/empty, limiting the scope for comprehensive defect discovery.
