

Doom PWAD QA Report

Purpose

To evaluate the Doom PWAD (WAD ID: e90e40b9-1f1e-49a0-a473-c91fdc069b61) for general playability and adherence to expected gameplay mechanics, including map navigation, combat engagement, resource balance, and secret discovery.

Summary

The automated test run for map E1M1 was cancelled prematurely, resulting in an outcome of 'cancelled' and no recorded gameplay duration. Zero total actions were taken by the agent, and no items, kills, deaths, or secrets were collected or found. This run therefore provides no data regarding the map's playability or specific gameplay metrics.

Environment

The test was initiated for map E1M1 using freedoom1 as the IWAD, set at difficulty level 3. The autonomous agent utilized the gemini-2.5-flash LLM model. The run concluded with a status of 'cancelled' before any meaningful gameplay could occur.

Defects

No specific defects within the PWAD were identified, as the test run was cancelled before any gameplay could be recorded. The cancellation itself represents a failure to complete the intended testing, preventing any assessment of potential defects related to map design, combat, or resource balance. The defect count for this run is 0, as no in-game issues were encountered due to the lack of activity.
